

# Handling of Specifics Concerning VaR Method

As of April 2026

Japan Securities Clearing Corporation

Item	Description	Remarks
<p>I Outlines</p> <p>II Historical Simulation Method (HS-VaR Method)</p> <p>1. Historical Scenario</p> <p>(1) The number of fluctuation days for market data</p> <p>(2) Type of fluctuations related to market data</p>	<ul style="list-style-type: none"> <li>• This document sets out the specifics concerning calculation method for the Amount Required for Margin related to Futures and Option Contracts (VaR Method) pursuant to the provisions of “Handling of Rules on Margins, etc. for Futures and Option Contracts” and “Handling of Rules on Margin for Business of Assuming Commodity Transaction Debts”.</li> <li>• The number of fluctuation days in generating historical scenario is 2.</li> <li>• Type of fluctuation related to market data used to generate historical scenario is logarithm fluctuation rate. However, for Settlement Price related to Electricity Futures Contracts and interest rate, it is fluctuation width.</li> </ul>	<ul style="list-style-type: none"> <li>• Unless otherwise separately stated, the rules mentioned in left column shall be collectively referred to as “Handling of Rules on Margins, etc..”</li> <li>• Handling of Rules on Margins, etc. Appendix 1 (note 2)</li> <li>• Market data means settlement price for futures contracts and the underlying asset price, implied volatility and interest rate for option contracts.</li> </ul>

(3) Adjustment method of Historical Scenario

- The adjustment method of Historical scenario is the one using weighted average of (a) and (b) by a certain weight (1-w: w).  
 (a) Historical Scenario adjusted by EWMA (Exponentially Weighted Moving Average) method (decay factor  $\lambda$ ).  
 (b) Historical Scenario without EWMA adjustment

- Parameters related to historical scenario adjustment are shown below.

Products	$\lambda$	w
Products covered by Index Futures Clearing Qualification	0.940	0.5
Other products	0.985	0.0

2. Stress Scenario

- Stress Scenario shall be generated based on historical data in and after 2008 and hypothetical data as in extreme but plausible market condition.

- Handling of Rules on Margins, etc. Appendix 1b

3. Specifics on calculation method of Expected Loss Amount

(1) Calculation method of Expected Profit/Loss 99% Coverage Amount

- The amount equivalent to 99%, when fluctuation amount (Profit/Loss) is ordered in descending order ("Expected Profit/Loss 99% Coverage Amount") shall be calculated by averaging the bottom 2.5% fluctuation amount based on historical scenario (1250) and stress scenario (2).

- Handling of Rules on Margins, etc. Appendix 1t, main text

- As for reference period of historical scenario, if 1250 days which are equivalent to 5 years are acknowledged as inappropriate, JSCC shall separately prescribe the period.

(2) Policy on risk offset limit

- As a general rule, Expected Profit/Loss 99% Coverage Amount shall be

- The top two smallest fluctuation amounts among fluctuation amount calculated based on stress scenario shall be used for Expected Profit/Loss 99% Coverage Amount calculation.
- No risk offset shall be set between

calculated deeming all transactions under the same Clearing Qualification as one portfolio, provided, however, in case of ii below, to set a certain level restriction on the risk offset amount (risk offset limit), aggregation group shall be set under Clearing Qualification layer (the most upper layer aggregation group) and Expected Profit/Loss 99% Coverage Amount shall be calculated pursuant to the formula i.

i. Calculation formula for offset limit

$$\text{Max} [X, Y - a(Y - X), bY]$$

X: The amount calculated by upper-level aggregation group

Y: Total sum of the amount calculated for each aggregation group

a, b : Parameters for offset limit

ii. Groups subject to offset limit and parameter value

Group	a	b
Electricity / LNG	0.8	0.2
Index Futures / TSE REIT Index / FX	0.8	0.65

commodities applying HS-VaR Method and those applying AS-VaR Method.

- Aggregation group can be set as multiple layers under the Clearing Qualification. Starting from the aggregation group in the lowest layer, the formula i in left column shall be calculated and the amount obtained by deeming X as the amount for the most upper aggregation group unit shall be the Expected Profit/Loss 99% Coverage Amount for the portfolio related to the corresponding Clearing Qualification.

III Alternative Simulation Method (AS- VaR Method)

1.Covered commodities

- Commodities subject to Alternative Simulation Method are shown below.

i. Dividend Index Futures Contracts

ii. Commodity Futures/Option Contracts (excluding Electricity Futures Contracts and LNG Futures Contracts)

2.Calculation Method and others

- Calculation method and parameter setting method for Alternative Simulation Method shall be prescribed in Annex "Outlines of AS-VaR Method calculation."

- Handling of Rules on Margins, etc. Appendix 1, proviso

## Outlines of AS-VaR Method Calculation

Item	Description	Remark
I Objectives	<ul style="list-style-type: none"> <li>These outlines set out the calculation method of Alternative Simulation Method (AS-VaR Method) and the parameters and alike necessary for calculation by the relevant method (hereinafter referred to as “AS-VaR Parameters”) among margin calculation of Futures/Options Contracts.</li> </ul>	
II Calculation method 1.Calculation of Scenario Profit/Loss  2.Calculation of Expected Profit/Loss 99% coverage amount 3.Calculation of margin amount	<ul style="list-style-type: none"> <li>Each Combined Commodity (referred to the group comprised of Futures/Options instruments with the same underlying asset; the same applies hereinafter), 30 scenarios (see Annex 1) which are combinations of fluctuation width and direction of each parameter prescribed in III are generated to calculate Profit/Loss for each scenario.</li> <li>The smallest value among the value adding intercommodity spread risk to each scenario’s profit/loss shall be Expected Profit/Loss 99% Coverage Amount.</li> <li>By aggregating Expected Profit/Loss 99% Coverage Amount within the same Clearing Qualification category and deducting credit related to intercommodity risk offset, calculate margin amount for the relevant Clearing Qualification category.</li> </ul>	<ul style="list-style-type: none"> <li>Assumption for fluctuation of parameters and fluctuation direction for each scenario shall not be reviewed regularly, however, if JSCC acknowledges as necessary, JSCC shall revise a part or all of them.</li> <li>When JSCC acknowledges as necessary, JSCC may set restriction on intercommodity risk offset.</li> </ul>
III Regularly-reviewed AS-VaR Parameter	<ul style="list-style-type: none"> <li>JSCC, as a general rule, shall set AS-VaR Parameters for each Combined Commodities subject to AS-VaR Method, review AS-VaR Parameters on the last business day of every week and post them on JSCC’s site within the day. If a revision is acknowledged as necessary, a part or all of parameters</li> </ul>	<ul style="list-style-type: none"> <li>No AS-VaR Parameters shall be set for contracts currently suspended.</li> </ul>
